Nancy Grace Roman Space Telescope
Science Operations Center (SOC)
Data Management System

Harry Ferguson
November 15, 2021
STScI provides the Science Operations Center (SOC) within a distributed Ground System Architecture

- **Planning & Scheduling**
  - All mission observations

- **WFI Data processing**
  - Details depend on mode

- **Archive**
  - for all observations

- **Community interface for WFI imaging**
  - User support, documentation, public outreach

Remaining Ground System functions: IPAC, GSFC, …
Planning and Scheduling System

- Adapted from HST/JWST “Astronomer’s Proposal Tool”
- Significant heritage for other parts of scheduling system
- Campaign-scheduling approach to long-term planning
  - Optimize surveys while allowing interleaving of different programs

Roman APT Example: High Latitude Wide Area Survey with imaging+spectroscopy
• SOC Scientists perform a range of activities
  • (co-)chair project-wide Working Groups with project and community scientists on a range of scientific and technical topics
  • Organize Hack Days, Focus Meetings, Jamborees, etc.
  • User support of Science Teams (or are themselves co-investigators)
  • White papers and documentation to inform the community about Roman’s scientific capabilities & opportunities

Solar system science with the Wide-Field Infrared Survey Telescope

Brammer (NBI), P. Capak (Caltech), I. Davidzon (Caltech), G. De Rosa (STScI), M. E. Dickinson (NOAO), D. Doré (JPL), J. S. Dunlop (ROE), R. S. Ellis (UCL), X. Fan (Arizona), G. G. Fazio (CfA), H.

ASTRO 2020

Astrophysics > Instrumentation and Methods for Astrophysics

On the need for synthetic data and robust data simulators in the 2020s

Molly S. Peeples (STScI/JHU), Bjorn Emonts (NRAO), Mark Kyprianou (STScI), Matthew T. Penny (Ohio State), Gregory F. Snyder (STScI), Christopher C. Stark (STScI), Michael Troxel (Duke), Neil T. Zimmerman (GSFC), John ZuHone (Harvard–Smithsonian CfA)
WFI/Imaging Calibration Planning

- Required accuracies up to ~10x better than what is available on other missions (e.g., Hubble)

  Expected shear power spectrum
  
  (Science Definition Team report, Spergel+ 2015)

  Simulated microlensing event (S. Carey)

  Ratio between white dwarf spectral models (Bohlin+ 2014)

  0.5% ABSOLUTE color calibration for SNe
  (maps to luminosity distance vs redshift)
The Data Management System

NASA Astrophysics Big Data:
- Data accumulated per week likely to be $>100x$ Hubble
- Both catalogs and pixel-level data sets provide unique science opportunities
-Downloading and processing exceeds resources typically available
- Most research will be archival, given the survey nature of the mission

Science data products from multiple mission partners
- Calibrated and mosaiced images, extracted spectra, catalogs, etc.
- Staged in the cloud and co-located with significant computational resources
- Open source, modular imaging pipeline facilitates custom reprocessing

Data storage & processing
- Cloud-based high-level data processing brings software to the data
- JupyterLab environments ease access, sharing and repeatability
- Software environment for the community in sync with mission data processing
Roman Data Management

STScI Science Operations Center
Data Management System

- WFI Exposure-level processing
- WFI High-level processing

IPAC Science Support Center
- WFI high-level processing
- Microlensing & spectroscopy
- CGI data analysis environment

Science community

Data and software

- Downlinked science data
- Low-level processed data
- Archive
- Science ready data
Exposure Level Processing Flow
Data Products

• **Array data**
  - Level 1 – raw
  - Level 2 – instrument signatures removed; aligned to Gaia to <1.3 mas precision
  - Level 3 – rectified and co-added
  - Level 4 – segmentation maps associated with catalogs
  - Queryable Empirical PSF library
  - Level 5 – community contributed products

• **Tabular data**
  - Level 4
    - Static Object catalogs
    - Variability catalogs (from aperture photometry and difference imaging)
    - Idealized source-injection: Catalog of inputs vs. outputs (photometry, sizes, shapes)
  - Level 5
    - Community-contributed products

• **Availability (levels 1-4)**
  - At the individual FOV level within 2 days of receipt of last relevant data
  - Consistently-calibrated data of survey areas released within 6 months
Simulations: Instrumental Signatures

- **Intended as a tool for pipeline development & testing**
  - Not optimized for use in a pipeline

Simulations: Idealized

- Intended both to be both by the SOC and as a user tool for custom analysis
- Can be used to inject sources into images, or create entirely new images

**Inputs:**
- Parameters to describe the properties of individual sources
- Parameters to describe the collection of individual sources

**Operations:**
- Apply the instrumental throughputs (using synphot)
  - SEDs or data cube in physical units -> Images in counts/s
- Convert the model shapes into an image
- Convolve with the point-spread function
- Add background
- Apply geometric distortions (if simulating level-2 outputs)
- Resample to the appropriate detector pixel geometry
- Add noise

**Outputs:**
- Source “truth” catalog constructed from the input distributions
- Images in the format of Level 2 output products (i.e. calibrated, but unrectified images), or Level 3 output products (rectified)

STIPS
Image Simulator

Field of View Overlay

Simulated Roman Observation of Andromeda
(B. Williams with aid of STIPS)

Complementary to tools developed by the community and other partners
Catalogs: Static

- Primary cosmology-related goal is to enable accurate photometric redshifts
- Accurate, well-characterized photometry and shape measurements will also enable a wide range of general astrophysics

**Inputs:**
- Level 3 images

**Operations**
- Estimate and subtract background
- Convolve with a detection kernel
- Identify connected pixels above a noise-dependent threshold
- Hierarchically de-blend overlapping sources
- Measure fluxes through apertures
  - With and without convolution by a PSF-matching kernel to correct all photometry to one reference PSF
- Measure shapes
- Star-galaxy classification based on shapes (only)
- Compute photometric redshifts from multi-band (Roman only) photometry

**Outputs**
- Level 4 catalogs including uncertainties computed from noise model
  - Photometry, positions, shapes, & local background estimates
  - Astrometry aligned to Gaia
- Level 4 segmentation maps
- Catalogs of input & output parameters for injected artificial sources
Catalogs: Variability

• To be run in the pipeline to satisfy the requirement for time-domain information for variable sources

• Photometry-based variability catalogs
  • Inputs
    • Release-level merged survey catalogs
    • Individual images (level 2 or level 3)
  • Operations
    • Compare flux in static catalog to fluxes in individual images
  • Outputs
    • Database of the individual-image photometry for the entire survey area with variability index

• Difference-imaging variability catalogs
  • Inputs
    • Individual rectified images that overlap spatially
  • Operations
    • Convolve with PSF-matching kernel if needed
    • Subtract a template constructed from all but the most recent image
    • Identify point-sources in the difference above a threshold
  • Outputs
    • Level 4 catalog of sources that exceeded the threshold along with associated metadata
Community-Contributed Products

- Public data products contributed by the science community are likely to be widely used. Examples include:
  - Joint photometry with complementary data sets
  - Photometric redshifts that use complementary data sets
  - Value-added catalogs of derived properties (e.g. from SED fitting)
  - Hybrid spectroscopic and photometric catalogs
  - Survey-level calibrations
    - Improved astrometry & photometry after constraining for consistency across the full survey
    - Window functions, masks, PSF kernels, etc.
  - Transient-free template images

- Details & cadence to be defined through future community engagement and opportunities
Archive

- **All Roman Science Data are Public and retrievable from MAST**
  - Includes data from SOC, SSC, Integration & Test, & high-level community products

- **Expect archive services to evolve**
  - Currently incorporating Jupyter analysis & visualization tools for JWST
  - Improving access to high-level products with services like z.mast and exo.mast

- **Higher-level products will be available in the cloud as well**
  - SOC produced Level 2 and beyond
  - SSC high-level products
Accessing Roman Data

- **STScI archive services**
  - Bring data to the users
- **Roman Science Platform**
  - Brings users to the data

---

**Roman DMS User**

- Cloud Services
  - Science Platform
    - Read access
    - High-level WFI data
  - Data Access APIs
- Archive User Interface
  - Exposure-level WFI data

---

17
Why the Cloud?

- Putting both the computing and the science-ready data in the commercial cloud offers the following benefits:
  - Convenient scalability for both data volume and computational demands
  - Flexible solutions for specific computing needs (e.g. GPUs or I/O optimized computing)
  - Lower total costs to NASA relative to multiple on-site installations

- Benefits to the science users include:
  - Efficient access to the data
  - Computing resources for exploratory work are available with no need to write a grant proposal
  - Local IT and software support costs are greatly diminished
  - Easier collaboration with astronomers across institutions
  - A powerful and stable science software environment
Community use of the HLPP

- Log in with your MyST account
- JupyterHub instance
  - Roman science calibration pipeline software installed and configured
  - Full Python + Astropy ecosystem installed and configured
  - Ability to install other packages and your own code
- Flexible, scalable architecture
  - Simple to add CPU & storage
  - High-throughput access to the data
  - Can scale up resources (e.g. GPUs or neural engines) as science needs & technology evolves
The platform should provide a sufficient base level of resources
  - Most NASA Roman grants wouldn’t need a computing line item.
  - Projects needing exceptional resources (“consortia”) could still apply for funds
  - Allows much more global optimization for science than case where funds are locked in small grants.

Tier concept to support most users

<table>
<thead>
<tr>
<th>Tier</th>
<th>Users</th>
<th>Typical sky area processed per user</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry</td>
<td>5000</td>
<td>A few</td>
</tr>
<tr>
<td>Research</td>
<td>1500</td>
<td>Tens to hundreds</td>
</tr>
<tr>
<td>Team</td>
<td>50*</td>

</tbody>
</table>

*Team & Consortium: multiple users share resources
*Will require periodic renewal

Looking to enable ~1000 Roman papers/year
  - The Roman-data-intensive work; not all the computing
  - Not long-term archival storage of intermediate projects
• Roman is a unique observatory that will advance a wide range of astrophysical questions, and is complementary to other exciting missions and projects for the coming decade

• In its role as the Science Operations Center, STScI is working collaboratively with all other mission partners and the astronomical community to make Roman a success

• Excellent progress has been made on the design of the Roman SOC; system development has now started

• The Roman Data Management System at STScI will be the key to unlocking Roman’s scientific potential, including innovative approaches to address Roman’s key Big Data challenges
